

In-Class Demonstration Assessment (Weight: 7.5%): Week7-8

Git Branching, Merging and Conflict Resolution

Overview

This individual in-class demonstration assesses your practical ability to use Git for common version control workflows. Rather than describing Git concepts, you will demonstrate that you can perform essential Git operations on a repository under time constraints. The assessment focuses on practical competency with branching, committing, merging and resolving merge conflicts.

Attendance Requirement

The demonstration will be conducted during the applied class in **Week7** and **Week8**, and students are expected to attend their allocated applied session. Attendance at the scheduled applied session is compulsory. Students who are unable to attend due to exceptional circumstances must follow the University's special consideration procedures.

Repository

The following public repository is provided for git skills demonstration purpose:

https://git.infotech.monash.edu/zmir0004/git_skills_demonstration.git

Students are expected to become familiar with its structure and contents prior to the assessment. No major programming task is required; the emphasis is on demonstrating correct Git workflows.

Students must clone the repository on their computer before attending the demonstration.

Expected Demonstration Tasks

- Create a new Git branch from the main branch.
- Switch between branches using appropriate Git commands.
- Implement simple changes to the code or repository (for example, adding a small function, modifying configuration values, or making another meaningful change).
- Stage and commit the changes with an appropriate commit message.
- Merge branches into the main branch.
- Resolve any merge conflicts that arise during the merge process.
- Verify that the repository is in a clean state after the merge and the program still runs.

Assessment Conditions

- The demonstration will be completed individually during the allocated applied session.
- A strict time limit applies. Students are expected to complete the required Git workflow within the allocated demonstration time.
- The assessment is intended to evaluate Git proficiency rather than programming ability. Changes to the code are therefore small and straightforward.
- Demonstrators may ask brief questions to verify your understanding of the Git operations being performed.
